7750 alcatel manual

The IEEE 802.3af committee ratified PoE for Fast Ethernet as well as for GigE. Devices with the WiFilogo have been certified. Access can be intelligently granted to any devices based on macaddress, via a captive portal or using an 802.1X supplicant. Quarantine Manager isolates attacks to the IP infrastructure without requiring client-based code. Quarantining is based on information retrieved by AlcatelLucent switches that have been attacked or any device that can send a fault message containing the attacker's source address. The Low Power logo indicates the devices are optimized in their energy consumption. The Metro Ethernet Forum MEF is a global industry alliance comprising more than 120 organizations including telecommunications service providers, cable operators, MSOs, network equipment, test vendors, labs and software manufacturers, semiconductors vendors and testing organizations. www.metroethernetforum.org The Traffic Anomaly Detection feature is used to detect anomalies through statistical analysis of network traffic. Such anomalies are detected in real time network traffic. Software Version 7750 SR OS 5.0. February 2007. Document Part Number 9300730301. With a vision and commitment to solve the networking complexities and continuous challenges driven by the use of video and multimedia applications and the convergence of residential, business and mobile networks, AlcatelLucent has delivered the innovative, leading edge Service Router portfolio for the new service edge. A key member of the Service Router portfolio, the 7750 SR has proven capable to evolve “in place” to ensure years of continued. Please check your inbox, and if you can’t find it, check your spam folder to make sure it didn’t end up there. Please also check your spam folder. The AlcatelLucent 7750 Service Router was designed with system characteristics, routing and service capabilities that have made it the platform of choice in more than 50 newgeneration service infrastructure rollouts. They understand that in order to be successful they need a service delivery infrastructure that offers more bandwidth, delivered flexibly and reliably to more customers simultaneously, with increased service level guarantees. Highspeed Internet HSI infrastructures were built around inefficient business models that focused on costper subscriber considerations and allowed for significant oversubscription and service level leniency. New highSLA voice and video applications have very stringent availability, system characteristics, quality of service QoS, multicast and service requirements. Those requirements can only be costeffectively addressed by rethinking the overall service delivery infrastructure. The 7750 SR provides the necessary builtin services capabilities and packet processing headroom to allow service providers to scale service instances, subscriber count and bandwidth without incurring exponential capital or operating expenditures CAPEX or OPEX. This inflection point is where the AlcatelLucent 7750 SR has established a leadership position.

They do not have the highavailability, scalability or service capabilities that will allow them to costeffectively enable largescale tens of millions of customers, highspeed data, voice and video service rollouts.
