propertyAnother useful accessory is a Remote Switch Adapter T3, a shortCredit ImageAll rights reserved.The medium is via infrared pulse to trigger the cameraThe infrared Remote LC Set remains as the most sophisticatedCertain content andThe creator of this site willNeither Nikon or. It may not display this or other websites correctly. You should upgrade or use an alternative browser. Now, thanks to Canons new Wireless Controller LC5, photographers can easily create compelling closeups from a safe and secure lineofsight distance of up to 330 feet. Far more than a wireless shutter release, this newly enhanced infrared remote provides photographers with the flexibility to control essential camera functions without intruding on the scene.

The Canon Wireless Controller LC5 simply attaches to a compatible cameras accessory shoe or can be separately attached to a supplied bracket and connected to the cameras threepronged N3 Remote socket with the supplied 15inch receiver cable. The unit is triggered with a pocketsized transmitter that sends an infrared pulsemodulated strobe signal to the receiver. Powered by 4 AA alkaline batteries approximately 4,500 operations per set, the LC5 controller is also compatible with AAsize Lithium, oxyride and Nickelhydride rechargeable batteries. Offering photographers the situational adaptability of four control modes, the LC5 can be set to SingleShot mode which captures one shot each time the transmitter button is pressed; Continuous mode which signals the receiver to keep firing the camera until the transmitter button is pressed again or until the cameras buffer memory limit or maximum storage card capacity is reached; Test mode which illuminates a red LED on the receiver to confirm that the unit is operating properly before shooting, and Delay mode which fires a single shot approximately 3.5 seconds after the transmitter button is pressed. The Wireless Controller LC5 is also equipped with three channel settings A, B and C to ensure that multiple remote Canon users do not inadvertently set off someone elses camera or in situations where a single photographer is remotely triggering more than one camera setup. In that instance the photographer has the option of firing the separate cameras individually and at will or all at once by selecting the units ALL setting. Whether capturing nature shots in macro mode or intimate wildlife studies that must be fired at a distance, Canons Wireless Controller LC5 expands the ease and with it, the opportunities for unmanned but not unmonitored photography.

Among the expanded capabilities offered by the LC5 that were unavailable on the predecessor models is the improved oneshot release mode 1SR that permits the photographer to prefocus the camera and then essentially lay in wait.By pressing the LC5 transmitter trigger fully, the LC5 remote receiver can now wake the camera from its energy saving sleep mode and capture at will the image that the photographer has patiently been waiting for. In other than 1SR mode, the photographer need only depress the remote transmitters trigger button halfway to engage the cameras autofocus before shooting. The Wireless Controller LC5s components transmitter, receiver and bracket.The unit is compatible with Canons prosumer EOS 20D digital SLR and its predecessor the EOS 10D as well as the professional digital SLR cameras including the EOS1D, EOS1Ds, EOS1D Mark II and EOS1Ds Mark II. Not limited to use on digital models, the Wireless Controller LC5 is also compatible with several EOS 35mm filmbased SLR models including the EOS3 and the EOS1v.Details on the LC5 which replaced the LC4 can be found here Youd be much better off getting the Adidt wireless remote via ebay or some other sellers its a lot cheaper, radio triggered rather than IR so you dont need line of sight, and doubles as a wired remote, and available in a variety of maximum ranges. You should upgrade or use an alternative browser. By continuing to use this site, you are agreeing to our use of cookies. Learn More. Much appreciated. Ive had my Metz 45 CT1 for years, used it mostly with my Bronica. My Sony A99 ha. EOS 5D MkIII If I can use it what adapter should II useto connect flash to camera. I have the adapter cable for my old Canon F1n.Any advice appreciated NeilIll have to see what cables are available for the flash, I guess it is just a different cable that goes in the same place as the hotshoe adapter I am always opening the side cover up to connect timer for Time Lapse shoots. A case of seeing but not seeing.

So that connection will just fire the flash with no high voltages being applied back to the camera. That is what I had been warned about, not something I was sure I quite believed though, Can a flash gun ever damage a camera if wrong connection used. Or will it just not work Then put a voltmeter across plug from powered up CL4. If less you're OK. If more damage to camera sync possible. Was a very serious problem with early digital cameras. Later models have been raising their voltage protection levels. Some early Metz guns went over 300V. Later versions, sometimes of same model, reduced their voltages. I did not believe that there would be any voltage on the trigger side of the flash, I assumed it was just a switch contact to fire the flash and it was not connected to the flash power side circuitry at all. Thanks for that. I am not going to take the risk, Think it maybe time to dump the gun and just spend the cash on a new one, and get full ETTL and all the compatibility of a new unit. I have a handful of old Metz flashes, half of them with seriously high voltages. So when I used that one I just stuck it on an optical trigger. The weakest of my flashes is twice the power of a the biggest hot shoe system flash you can get. True I don't get the flexibility of TTL. What I get instead is the flexibility of having enough dispersible flash power to bounce light an entire church hall. It is the CT series that have high voltage trigger circuits exposed to the PC socket. These things are always useful to have around, whether directly attached to the camera or indirectly triggered. He also supplied me with a pinout for the external power plug. Top pin 18V DC Centre Pin ground 0v Lower pin 350V DC Now to think about building a 350V DC supply. on seconds thoughts. maybe not. Ill just stick with 20 AH packs of LiPo No wonder their accessory selection is such a mess. I have it hooked up via synch cord to my Nikon D800.

Im wondering, if I was able to find the hot shoe adapter, if it would work with my in camera TTL. Hoping it will be great for outdoor wedding portraits and big dark church settings. Neil, have you been experimenting with it attached to your Cannon How can i shoot on 2nd curtain with my 1ds mark II in combination with the Metz 45CL4 nondigital Anybody The adapter just gives you a PC connection. I think the 2nd curtain is a function of the camera and not the flash. The camera signals the flash to fire at different times for 1st or 2nd curtain. You do not need a sca 3102 adapter. Check the firing voltage for the Metz to be sure it will not harm your camera. My Metz 60 series is fine and I think most of the 45 series is OK, but check first. Have fun. If i put the settings from my 1DS mark II at 2nd curtain and hook up the Metz's PC Sync Cable to camera's PC Sync Socket, the Metz CL4 fires always at the 1st curtain. Listening to your story i have to buy the Metz sca 3102 Canon adapter, thats it. And what do they mean with SCA 3002 Adaptersystem Anybody. There was a different adapter for each camera or class. I do not think they will work with the digital signals I know you are trying to get it to sync with the second curtain, but if you want auto exposure you can use the flash's auto thyristor and set your aperture to match. I use mine in manual mode and often with as many as 4 flashes. Love the colour and the control on the 604 series. The most important thing is indeed rear curtain. I already asked Metz and will publish their answer tomorrow. Thanks Bob! However, the former flash unit mecablitz 45 CL4 isn't loaded with this special ETTL flash control. Therefore this flash unit only can be used in automatic flash mode with one of the 6 automatic apertures or in manual flash mode with the mentioned camera. Normally we recommend using the adapter SCA 3102 version M3 to M5 and the cable SCA 3000 C for connection.

Thereby the corresponding aperture and ISO also have to be manually set on the camera. Furthermore the adapter SCA 3102 is additionally equipped with some switches on the rear side. One of these switches is destined for the synchronisation on the first or second curtain. If you set the synchronisation on the second curtain the aforementioned flash unit also will be synchronised by the second curtain. Best regards i.A. Roland Laemmermann Technical Support Then i have ETTL II on the Canon and rear curtain. By using a dedicated flash you will be able to get 2nd curtain, but since the Metz will not be connected not sure how the ETTL will work Thanks everybody for your input. Greetings Steve. This might also be true for the ETTL system. Please let us know how this works for you. The other Flash is connected with a Nikon sca 343 adapter and a hama slave trigger attached to

the sca343. Someone gave them to me and they seem to work fine. Right now it says copyright abd right click will not work. Thanks Works great! Sorry for never answering your question all those months ago. I have not been getting notification that this question was being updated. But, No, I never hooked the 45CL4 direct to the Canon 5D3. I only ever used it as a remote slave with basic optical trigger. How do you connect the flash to the receiver. Never have to worry about the cable or broken PC Cable. And it works very well on all digital cameras. I also had a phone call from Metz UK saying its completely safe to connect the Metz 45 CL4 non digital with the coiled pc sync cord to the side of camera. Through this thread Ive been able to send a few questions directly to Metz, using the link that someone was kind enough to post, and there are also some good answers here. I have an issue with getting notifications from Flickr as well. Im currently getting a crash course on mating Canons and Minolta Digitals to older Metz flashes!!! Re. Canon; the manual for my EOS30D says that the beast is good for 250 volts triggering.

What Im looking to mate to is 45CT1 late serial number, 45CT4, or 60CT1.
